Introduction

The goal for the article is to demonstrate several paradoxes that are related to probability theory and how can they can be solved.

1 Base definitions of probability theory

I am going to provide several definitions. I will give the both formal and informal definitions and show how they are related each other.

We will start with the simplest example.

Example 1. *In the example we have (see fig. 1) $N = 5$ balls. There are $N_G = 2$ green balls and N_R red balls. I.e. $N = N_G + N_R$.*

Figure 1: Probability example

We can define the probability to get green ball as

$$P_G = \frac{N_G}{N} = \frac{2}{5}$$

and the probability to get red ball as

$$P_R = \frac{N_R}{N} = \frac{3}{5}.$$

We can get only a red or a green ball and

$$P_G + P_R = 1.$$

Figure 2: Probability space. It consists of elementary events: a , b , c and d , each of them has equal probability $p_{a,b,c,d} = \frac{1}{4}$

Figure 3: Condition probability. Original probability space. $P(R) = \frac{5}{6}$, $P(B) = \frac{3}{6}$, $P(G) = \frac{4}{6}$

Now we are ready to give several formal definitions.

Definition 1.1 (σ algebra). *Let Ω is a set then a collection \mathcal{F} of sub sets of Ω is called σ algebra if the following conditions are satisfied:*

1. \mathcal{F} contains Ω : $\Omega \in \mathcal{F}$
2. TBD
3. TBD

In our example 1, σ algebra is a collection of any balls.
TBD [1]

2 Monty Hall problem

TBD

3 Waiting time on a bus stop

TBD
